# Int 21H, AH=28H

## Version

1 and higher

## Brief

RANDOM BLOCK WRITE TO FCB FILE

## Family API

## Input

```
AH = 28h
CX = number of records to write
DS:DX -> opened FCB (see #01345)
Disk Transfer Area contains records to be written
```

## Return

AL = status

```
00h successful
01h disk full or file read-only
02h segment wrap in DTA
CX = number of records written
```

## Notes

```
write begins at current file position as specified in FCB; the file
position is updated after writing
```

```

if CX = 0000h on entry, no data is written; instead the file size is
    adjusted to be the same as the file position specified by the random
    record and record size fields of the FCB
if the data to be written is less than a disk sector, it is copied
into
    a DOS disk buffer, to be written out to disk at a later time
not supported by MS Windows 3.0 DOSX.EXE DOS extender
    
```
